PillBox

Description

The App is a medicine reminder app. It helps the user to keep a track of all the medicines one has to take at certain times in a day.

Intended User

The app is intended for elderly people or anyone who takes multiple medicines in a day. It is also for any normal user who forgets about their medicines and thus can keep a track of it through the widgets.

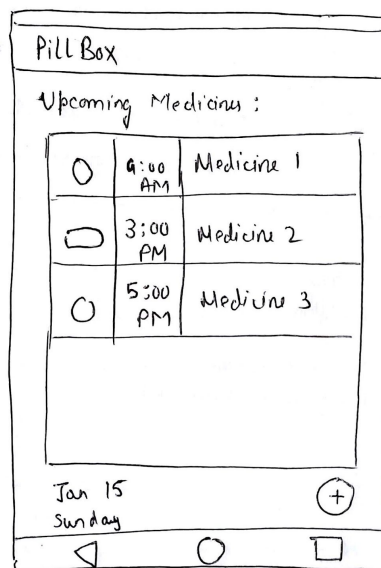

Features

In PillBox, the user can :

- Save Medication along with its several other details
- Keep a track of upcoming medicines for the day on main screen and in a widget
- Add/delete medications with ease

User Interface Mocks

Main activity

Shows upcoming medicines for day

Add medication activity

x Add Medication DONE

Medication Name

Reminder Times

Once a day ▼

8:30 AM Take!

Shape & Colour

□ □ □ □ □ □

Screen to add medicine

Details Activity

Medicine 1

Taken once a day

Upcoming Reminders

● 9:00 AM Instructions

□ □ □

🗑️

Shows all the details about the medicine and a delete button to delete the medicine

Widget

PillBox		
○	9:00 AM	Medicine 1
○	3:00 PM	Medicine 2
○	5:00	Medicine 3

Collection widget which is resizable

Key Considerations

How will your app handle data persistence?

The app will save the medicine information along with all its attributes in sqlite database by implementing a content provider.

Describe any corner cases in the UX.

An alert dialog is displayed to confirm if a user wants to delete a medicine.
Also a snackbar is displayed if user tries to save a medicine without a name

Describe any libraries you'll be using and share your reasoning for including them.

ButterKnife will be used for binding views and Schematic to implement Content Provider

Describe how you will implement Google Play Services.

Firebase Analytics will be used to keep a track of the number of times a user takes certain medicine in a day. The frequency of medicine by most users will help add more features in the app in future.

Firebase Admob will be added in the add medicine activity

Next Steps: Required Tasks

Task 1: Project Setup

Create a new project in Android Studio and add the required compile dependencies in gradle. Also delete any auto generated code by the Android Studio if not necessary. Create Stub views for main activity and add a FAB to launch add medication activity.

Task 2: Implement Add medication activity and content provider

- This is the only activity where user will input any data.
- Make various card views, each for taking an input of a certain characteristic of the medicine
- Implement Content Provider with all the required columns
- Bind these card views to the code and verify/save user's input in the database

Task 3: Implement Main activity and Details activity

- Show the upcoming medicines for the day in list format on the main screen
- Clicking each item will take the user to a details screen and from here the particular medicine can be deleted

Task 4: Implement widgets and add google services

- Implement a collection widget
- Add Firebase analytics and Firebase admob to the app

Task 5: Final touch

- Make sure of all the guidelines followed
- Add standard transitions to the app
- Test the app for various use cases

Showing developer's profile

The app will have a developer's profile and contact information screen which will be loaded from a web server
